

iEnvision Datavision®

- iEnvision Datavision is designed to drive the compliant and efficient management of scientific and medical publications
 - iEnvision has been creating software to manage publications for more than 20 years, and the latest Datavision release draws on all this experience
- The workflows within Datavision promote compliance with Good Publication Practice and the International Committee of Medical Journal Editors (ICMJE) requirements
 - iEnvision can also be configured to align with your company's standard operating procedures (SOPs)
 - Checklists and system validation ensure compliance with these SOP requirements
- Auditing capabilities for reviews, author involvement, and approvals come as standard
- Wizard-based document creation and copy function ensures that publication records are produced efficiently
- Role-specific Dashboards are provided to ensure that publication managers have the detailed information they require to start and manage publications, whereas reviewers are not overwhelmed with too much detail

Compliant and efficient management

Auditing capabilities as standard

Wizard-based document creation

Role-specific Dashboards

Checklists and system validation ensure compliance

Configurable to align with your company's SOPs

Multiple review options, including live document review with doDOC®

Three review options are now available within iEnvision Datavision:

Live document review for Word files using the iEnvision: doDOC integration, recommended for most document reviews

Download only review as in Datavision Classic, which can be used for all file types including PowerPoint, audio, and video files

PDFTron: annotation review used on PDF files; used typically for near-final drafts of posters or presentations

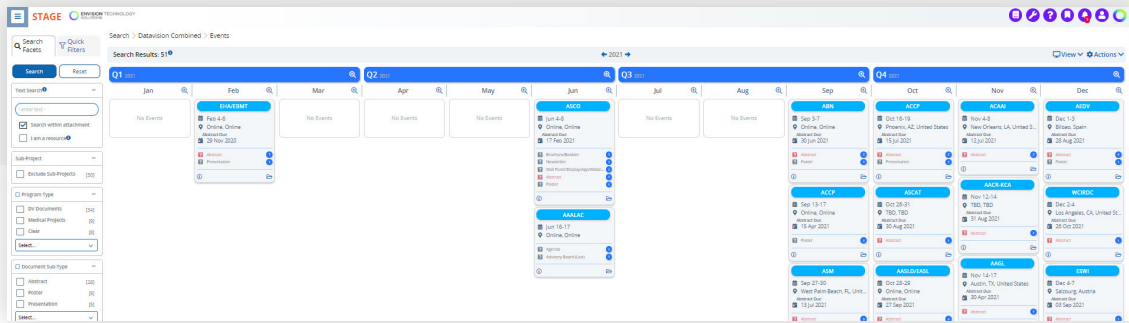

doDOC allows multiple people to write and review content in the same document at the same time. This accelerates collaboration and enables fast decision-making

- Each deletion, addition, or edit is tracked and registered within doDOC, providing full auditability and complete version control of a document, without unnecessary compilations and parallel systems
- Once a review stage is complete, a consolidated Word document with all participants' changes and comments is posted in iEnvision and available for download

Authors and reviewers can view the feedback from their co-reviewers on both the current and past review steps regardless of which review option is selected

Broad range of reporting options, including calendar view

- The Publication Manager's Dashboard contains top-line metrics such as the overall acceptance rate of abstracts and manuscripts, journal submission outcomes, and the actual versus planned average time to first submission
- A vast array of information is available from the portfolio search, which has numerous search facets and column headers available for a user to select and build tables to report on their publications
 - Multiple views can be saved by the user
 - Search results can be exported to Excel for further analysis
 - Data from Datavision can also be utilized by data visualization and analytics systems such as Qlik and Tableau
- A calendar overview of manuscripts or congress publications is now available as part of the portfolio search
 - The view can be expanded so that information on the individual publication can be displayed
 - Calendar view can be downloaded as an image to PowerPoint to facilitate the presentation of up-to-date plans by year, quarter, or month
- Fourteen preconfigured reports are available to aid audits and ensure you have all the information you need at your fingertips

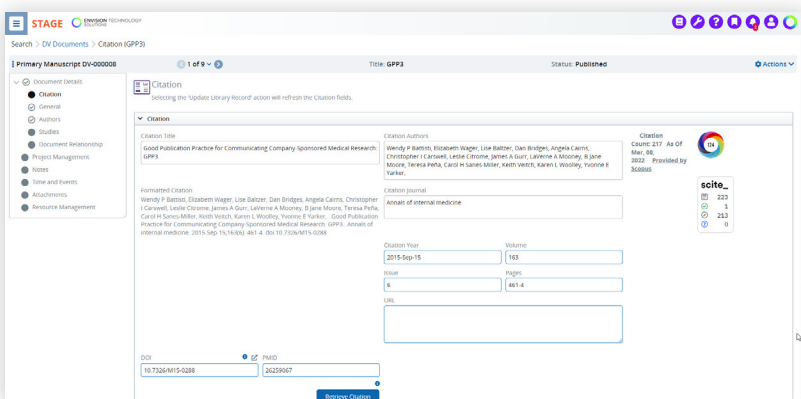

Datavision connects with other iEnvision solutions

- The iEnvision journals and congress database comes standard with Datavision and can be accessed outside of or within Datavision records to link publications to their target journals or congresses
- The journals database now contains ten SCImago journal metrics for each journal, including the SCImago Journal Rank (SJR)
 - The SJR excludes journal self-citations and weights citations by the prestige of the journal in which they appear, something not done by other well-known measures of a journal's impact

- Datavision is connected with iEnvision Library, allowing a new Library record to be created when a publication is published or presented. This connection enables users to utilize Library and share final documents with colleagues who may not have access to Datavision
- The Tactics view within the iEnvision Scientific Communication Platform (SCP) module permits users to track publications being developed within Datavision that support each scientific statement or theme with the product SCP – allowing the team to monitor in real time the support pipeline for each scientific statement and theme

- When a citation is added for a published paper, the Altmetric badge can be provided with a link to the Altmetric Dashboard for the paper providing key information on the news stories, Tweets relating to the paper, and details on recent citations of the paper. You can now also view post-publication citation counts provided by Scopus and citation context analysis from scite
